DOES YOUR SYNTHETIC GRASS BOWLING GREEN SUFFER FROM POOR DRAINAGE ISSUES?

Green Planet Grass & KCL Sports now have the solution. The On-site Perforating Machine (OPM).

the problem

Over time, algae, pollution, degraded yarn & other substances find their way into the drainage holes of the synthetic grass. This causes a gradual reduction in the drainage performance of your green. As these particles have made their way to the base of the synthetic grass, it's very difficult to access the area to remove them.

the solution

Our process creates new, clear holes in the surface with no detrimental impact on the bowling performance of your green. The new perforations are made in a similar configuration to the original factory perforations, with the added advantage that the new holes are also introduced into the seam area. (To prevent adhesive coming through to the surface during the installation process, this area isn't originally perforated at the factory.)

the machine – the OPM (On-site Perforating Machine)

Our custom-built machine runs 6 high-speed routers and is self-propelled to ensure a consistent spacing of the new perforations.

To see a video of the OPM in action at the Leeming Bowling Club, go to the Bowling Green page of our website. This maintenance was carried out on 2 greens & was completed within 2 days.

For more information regarding the OPM, or to enquire about our comprehensive maintenance service, contact Tony at Green Planet Grass on 9209 2669 or 0411 109 036.
